

This is An application for Checking your restaurant monbey use impacting CO2 emissions as well as keeping track of your weight

Niilo Horn made all of this

Design was winging it and i regret that decision immensely

Application only hass the basic requirements of the program: object-orientation, 5 classes , saves inputs to a log and allows one to look at the log  
it also uses a single API to calculate the CO2 impact of ones money usage on restaurants based on the finnish average.

13 points estimated

Estimated time used:

10 hours of actual work

100 hours of procrastination and crippling anxiety

i learned from this project that i work best under lots of stress and at night.

also that actually planning what to program would make it way easier.

and finally i also learned how to deal with JSON files with java which i hadn't quite grasped earlier.

Hardest part of this project was definetly the lack of planning on my part and the endless procrastination that ensued.
